Mail-Control
Mail-Security Testing
by AV-ATLAS

Data loss and operational failures caused by ransomware threaten your daily business?
Use Mail-Control to precisely check your Mail-Security for current threats and prevent damage from cyber attacks.

Mail-Control by AV-ATLAS
Check your Mail-Security

Targeted attacks, so-called Advanced Persistent Threats, on companies and governmental organisations usually start by E-Mail. Even one wrong click can lead to the spread of malware in important parts of the company network, or in the worst case, to a production stop, data loss and costly damage.
With Mail-Control you can check the reliability of your Mail-Security against current malware campaigns. Based on the detection systems of the Threat Intelligence Platform AV-ATLAS, the continuous review of your Mail-Security is carried out in real time by using controlled Malware-Mails.
E-Mail systems checked with Mail-Control are also awarded with the seal „Mail-Security verified by AV-ATLAS". Thus you strengthen your communication with customers by actively pointing out your defence against mail-based cyber attacks.
Mail-Control is a security solution from the renowned AV-TEST Institute, which has years of expertise in cyber security and malware research. Get your free consultation and request your free trial today.

The „Mail-Control – Mail-Security Testing by AV-ATLAS" service
includes the following:

- Test the protection efficacy of your Mail-Security. How safely are spam mails intercepted? Is there an „overblocking" compared to regular E-Mails?

- Real Malware Mail campaigns are used, for example ransomware and Emotet, collected by AV-TEST through its own honeypots.

- Continuous monitoring of the Mail-Security makes it immediately visible if a mail-based attack is not intercepted by the security systems.

- You can realistically assess and optimise the security situation and the protective effect of your Mail-Security against current attacks.

- Free 5-day test phase (with selected mail contingent).
